

# Missing Transitional Forms

Transitional forms are the living things that show the 'in between' stage between an ancestor and the modern living relative. While some were fossilised and have been found, others have not been. Artists use fossils to draw what they think the living thing would have looked like (the illustrations for dinosaurs for example). Can you work out what the transitional form would have looked like for the following living things?

Ancestor: <b>Indohyus</b>	Missing Transitional Form
	
Modern Living Thing: <b>Whale</b>
